nutritionDay is a worldwide initiative aiming to raise **awareness on disease-related malnutrition** in healthcare institutions and to enhance the quality of nutritional care

nutritionDay is carried out **every year in November** as a **1-day cross-sectional audit**, and it represents one of the largest international databases of hospitalized patients.

On a specific day, **nDay**, hospital wards and nursing homes around the world collect their unit's **anonymized** data and upload them to the **nDay worldwide database**.

Participating units receive a free **multidata graphical report** which compares unit's results to a worldwide reference. The report shows specific **quality indicators** of nutritional care and sets the basis for **benchmarking** and continuous monitoring of nutritional care within the unit.
